

Your Students Are Already Living in the **AI Economy**. Your Curriculum Isn't.

A complete, idiot-proof implementation toolkit for modernizing high school curriculum, classroom practice, and career preparation for the labor market your graduates are about to enter. This is the action guide — not the awareness guide.

Grades 9-12 Focus

Based on ITDF 2025-2026 Research

WEF Future of Jobs Report 2025

McKinsey · PwC · MIT · EDUCAUSE

⚡ **This is not a "the future is coming" document.** Entry-level job postings requiring AI skills grew 7x in two years. Your seniors are interviewing for those jobs. Right now.

♥ GOVERNANCE GUARDRAILS — NON-NEGOTIABLE

Faculty Authority

Curriculum changes go through existing teacher and faculty governance structures. The ACIL coordinates — faculty approve.

Parent Consultation

Families are consulted before adoption, not informed after. Pre-adoption listening sessions are required before any required course launch.

Course Changes

Course dissolution or new requirements go through board approval. AI audits identify; they do not eliminate.

Teachers Are Never Replaced

AI is a subject of study and a professional support tool. Human teachers remain responsible for instruction, assessment, and student relationships. Full stop.

SECTION 01 · THE CASE FOR URGENCY

The Data Every Superintendent Should Already Know

This section is intentionally brief. You don't need 40 pages of charts to know what's happening — you need enough data to walk into a board meeting and justify action. Here it is.

82%

of global technology experts say AI will play a significantly larger role in daily life and key societal systems in **10 years or less**

ITDF Human Resilience Report · 2026 · n=386

7×

AI fluency demand grew sevenfold in two years — from 1M to 7M workers whose roles explicitly require AI skills. That growth is not slowing.

PwC Global AI Jobs Barometer · 2025

20%

Software developers aged 22–25 saw an almost **20% employment decline** in 2025 vs. their 2022 peak. Entry-level white-collar jobs are the first hit.

DesignRush AI Displacement Statistics · 2026

56%

Workers with AI skills earn **56% more** than those without — up from 25% in 2023. This premium exists because the skill is still scarce. *Early-adopting districts produce graduates who capture it while it lasts.*

PwC Global AI Jobs Barometer · 2025 · (was 25% in 2023)

"The future of education is not about teaching students to use AI. It is about teaching them to remain the authors of their own thinking — even when AI is available to do the thinking for them."

SYNTHESIZED FROM ITDF BEING HUMAN IN 2035 REPORT, 2025

The Equity Problem Nobody Is Talking About Loudly Enough

AI disruption is not hitting students equally. **79% of employed women hold positions at high automation risk, compared to 58% of men.** The highest-risk clerical and administrative occupations are 86% female. If your district serves students — especially young women — who are preparing for administrative, customer service, or entry-level professional roles, inaction on AI education is a choice to leave those students more exposed. This is a civil rights issue dressed in technology language.

⚠ CAUTIONARY CASE: THE BENNETT SCHOOL, HOUSTON, APRIL 2026

In April 2026, ABC13 reported on the Bennett School — a Houston voucher school where students spend two hours per day on AI-powered laptops with no certified teachers, just "guides," and the rest of the day in athletic training. The video that ran with the story showed a room of kids on screens, no teacher at the front, no instruction happening. Houston Federation of Teachers president Jackie Anderson: "It's appalling that anyone thinks a person could be in school for two hours a day and academics are going to be crushed in." Parents online lost it. They weren't wrong to.

The Bennett School model may be an outlier. But it became the frame through which every AI-in-schools story that followed got read — including HISD's "Future 2" program, which is a separate initiative with teachers still in the room. Without a documented framework that clearly distinguishes responsible AI integration from what the Bennett School did, no district can tell that story credibly. When the standard doesn't exist, skepticism fills the gap. **This toolkit is the document that should exist before any program launches — so one school's failure doesn't contaminate everything that comes after it.**

⚠ WHAT WE DON'T KNOW (AND YOU SHOULD ACKNOWLEDGE THIS)

We don't know with certainty which specific jobs will exist in 2035–2040. We don't know the optimal age to introduce specific AI concepts — developmental research is genuinely early. We don't know whether every AI tool currently in classrooms will still be dominant in 2030. What we do know is that the skills required — critical thinking, ethical reasoning, AI fluency, data literacy, adaptability — are durable regardless of which specific tools survive. Build for those, not for ChatGPT specifically.

On the hype cycle risk: If AI disruption proves slower or differently shaped than current projections suggest, the curriculum choices in this toolkit remain sound. The durable competencies — verification, ethical reasoning, adaptability, critical evaluation — are valuable regardless of AI's specific trajectory. The 56% wage premium for AI skills exists today because the skill is scarce. As AI literacy becomes universal, that premium will compress — which is exactly why the districts that move first produce graduates who capture it for current cohorts, and why, eventually, AI literacy becomes the floor rather than the ceiling. The goal is not to create a permanent elite. It is to ensure no student arrives at the labor market without skills that are rapidly becoming baseline expectations.

SECTION 02 • FIRST MOVE

Before You Do Anything Else: Designate Your AI Curriculum Integration Lead

Every program that succeeds has one owner. Not a committee. Not a shared Google Doc with 14 stakeholders. One person. This is the first action item in this entire document, and everything else depends on it. Until you name this person, nothing else in this toolkit will be sustained.

Committees diffuse accountability. One named person with clear authority, adequate time, and direct access to you produces results. The committee produces the report about why results weren't produced.

Who Is This Person?

The AI Curriculum Integration Lead (ACIL) should be a **current, trusted, full-time faculty or staff member** — not an outside consultant, not the IT director, not a committee chair. Here is what to look for:

Look For These Traits

Who your ACIL should be

☐ **Respected by peers — not just by administration**

Faculty follow people they trust. A top-down appointment of someone unpopular will fail on contact with the faculty lounge. This is non-negotiable.

☐ **Already curious about technology**

They don't need to be an expert. They need to be genuinely interested and willing to learn publicly. Curiosity is trainable. Resistance isn't.

☐ **Comfortable with ambiguity**

AI education is moving faster than any curriculum committee. This person will need to make judgment calls without a playbook. They need to be okay with that.

☐ **A teacher-first identity**

They must stay connected to what happens in classrooms, not just in administrative planning. The best people for this role never stop thinking about how students experience learning.

☐ **Willing to hold people accountable**

This role requires following up when faculty don't complete PD, when departments don't update course materials, when commitments slip. They need to be able to have direct conversations.

Avoid These Assignments

Common mistakes that kill momentum

The IT Director

This is a curriculum and pedagogy job, not an infrastructure job. IT directors think about tools, not learning. These are different skill sets and different cultures.

An outside consultant

When the contract ends, the institutional knowledge leaves with them. This role requires sustained relationships with faculty, students, and community partners.

The most tech-enthusiastic teacher

Enthusiasm $\neq$ effectiveness. Someone who lives in Discord and loves every new app may not have the pedagogical depth or peer relationships to move an institution.

A committee of five people

If five people share the job, no one owns it. When things get hard, everyone is waiting for someone else to push. One owner. Clear authority. Full stop.

Someone who's already overloaded

If you add this to a teacher already running three extracurriculars and carrying a full load, you are setting them up to fail and the program up to die.

AI Curriculum Integration Lead (ACIL)

INTERNAL ROLE · REPORTS TO SUPERINTENDENT/PRINCIPAL · 2-YEAR APPOINTMENT, RENEWABLE

Post this internally. It should feel like an opportunity, not a burden. The right person will want this role. Compensation: **1-2 course release periods per semester + \$2,000-\$4,000 annual stipend (note: real implementation cost including substitute coverage is \$12,000-\$30,000+ annually; size the investment to match the mandate).**

WHAT THEY OWN

- Master task list for AI modernization implementation
- Faculty PD calendar — all AI training sessions
- Employer advisory council coordination
- Student AI Ethics Advisory Board facilitation
- Annual AI Readiness Report to the board
- Curriculum audit tracking and follow-up
- Resource library maintenance (updated quarterly)
- AI use policy maintenance and annual review

WHAT THEY DO NOT OWN

- Writing all curriculum (faculty write their own)
- Technical IT infrastructure or tool purchasing
- Disciplinary action for policy violations (admin function)
- Every teacher's individual lesson plans
- Budget authority beyond their stipend
- Community communications (that's you)
- HR decisions related to AI competency
- Being the only person who knows about AI

The ACIL's First 30 Days: Exact Action Steps

Hand this list to your ACIL on Day 1

☐ **Week 1: Complete the AI Landscape Survey**

Send a 10-question survey to every teacher: "Do you currently use AI tools? Which ones? Have you received AI-related PD in the last 12 months? What is your comfort level with AI tools on a 1-5 scale? What questions do you have about AI in your classroom?" This is the baseline. You cannot measure improvement without it.

☐ **Week 1: Audit every course that currently touches AI, data, or technology**

Create a simple spreadsheet: Course name | Teacher | Grade | Does it address AI? (Y/N) | What specifically does it cover? | Estimated % of students who take this course. This is your gap map.

☐ **Week 2: Complete the MIT/Google free Generative AI for Educators course**

Two hours. Free. Covers the basics every ACIL needs before facilitating faculty PD. URL: grow.google/ai-for-educators — also MIT RAISE has a parallel free course. Do both. Take notes on what faculty will struggle with.

☐ **Week 2: Contact AI4K12 and register for their educator community**

AI4K12 (ai4k12.org) is a CSTA/AAAI-backed initiative with free curriculum materials, grade-band progression charts, and a practitioner community. This is your primary curricular framework resource. Register and download their Five Big Ideas in AI poster and guidelines.

☐ **Week 3: Schedule one-on-one conversations with every department head**

Not a group meeting. Individual conversations. Ask: "What does your department currently do about AI? What are your teachers' biggest concerns? What would make this easier for your team?" Listen more than you talk. These relationships are your implementation infrastructure.

☐ **Week 4: Present a 90-day action plan to the Superintendent**

Not a vision document. A specific plan with named tasks, named owners, and named deadlines. You cannot hold yourself accountable without specific commitments.

Lessons Learned Documentation — Required, Not Optional

The 2-year cycle only compounds value if each iteration builds on the last. Without documentation, it starts from scratch every time.

Every ACIL produces a structured Lessons Learned document at the end of Year 1 and at the 2-year review. This is a required deliverable — filed in the district resource library and handed directly to their successor. Format: what worked and why, what failed and why, what surprised us about faculty resistance or student responses, what we would cut if we did it again, what we would start earlier, what resources were most and least used.

Without this document, the institutional knowledge generated in two years of implementation evaporates when the ACIL rotates. The 2-year cycle is only worth running if each iteration is smarter than the last. That requires written continuity.

Succession Planning — Do This Before You Need It

The ACIL role fails when it lives in one person's head

The most common implementation failure: a strong ACIL leaves after 14–18 months (underpaid, overloaded, recruited elsewhere), and the program dies because everything lived in their head and their relationships. Prevent this structurally, not reactively.

☐ **Name a Deputy ACIL by Month 6**

Not a backup. A co-participant who attends all meetings, owns at least one deliverable, and is prepared to step into the role with 4–6 weeks of overlap transition.

☐ **Build a shared, wiki-style resource library — not one person's Google Drive**

All PD materials, lesson plans, policy templates, and vendor contacts live in an institutionally owned shared repository. The ACIL contributes to it; they do not own it. When they leave, the library stays.

☐ **Quarterly workload audits**

The ACIL task list as described is substantial. At 90 days, 180 days, and annually: review which functions are being sustained, which have slipped, and whether the role design needs adjustment. An honest workload audit prevents the slow-motion burnout that kills programs.

☐ **If the ACIL leaves, trigger the succession plan within 30 days**

Not eventually. Thirty days. The deputy steps in. The resource library continues. The PD calendar is sustained. The program is not allowed to go dormant while administration debates next steps.

A note on collective bargaining and teacher associations.

In Texas, collective bargaining for teachers is limited — but teacher associations still influence culture, policy, and adoption. In other states, mandatory PD requirements, stipends, and course assignment changes may be subject to collective bargaining agreements. Before announcing implementation timelines, review any applicable contracts or MOUs. AI implementation that feels unilaterally imposed on teachers will fail faster than any policy failure. Frame this as professional development and career protection, not as compliance. Engage teacher association leadership early.

For Rural Districts and Small ISDs: The full ACIL model assumes institutional capacity that not every district has. Options: share a regional ACIL through your Education Service Center with neighboring districts; use free AI4K12 and MIT Day of AI resources with a single volunteer teacher lead; focus Year 1 entirely on teacher survey and AI use policy (no new courses, no new hires). A well-executed minimal viable implementation beats a half-implemented full model every time.

What to Add, What to Reform, What to Kill

This section makes specific recommendations. Some of them will be uncomfortable. That is intentional. The point of a tool like this is to say what is genuinely needed, not what is politically easiest. The ACIL's job is to build the consensus to

implement these recommendations. Your job is to create the permission structure for them to do it.

 HONEST CAVEAT ON CURRICULUM SPECIFICS

These recommendations are based on current labor market research, expert consensus, and pedagogical evidence. State standards and local context matter. Some of these will require waiver processes, SBOE engagement, or curriculum committee approval. That is expected and worth doing. None of these require you to invent something new — all recommended courses and frameworks already exist and are implemented in leading districts.

Courses to ADD to Required Curriculum ADD

AI Foundations — 1 Semester, Required, Grade 9 or 10

This does not exist at scale. It needs to.

A required, one-semester introduction to artificial intelligence that every high school student completes by 10th grade. This is not a computer science elective. It is a foundational literacy course — like requiring English, not like offering AP Physics. The AI4K12 Five Big Ideas framework provides the curriculum scaffolding for free.

WHAT THIS COURSE COVERS

- ☐ **How AI actually works — conceptually, not just technically**
Students need to understand that AI is pattern recognition from data, not magic and not sentient understanding. This conceptual model prevents both uncritical trust and irrational fear.
- ☐ **How AI is trained — and what that means for bias and errors**
AI outputs reflect the data they were trained on. If that data has bias, the AI has bias. Students who understand this become better critics of AI outputs in every context.
- ☐ **Using AI tools as a productivity co-pilot — hands-on practice**
Students should leave this course having used at least 3–4 different AI tools in meaningful tasks: research assistance, writing support, data analysis, image generation. Not just knowing they exist.
- ☐ **Evaluating and fact-checking AI outputs — as a core protocol**
AI confidently produces false information. This is a feature of how these systems work, not a temporary bug. Students must have a repeatable verification protocol before leaving this course.
- ☐ **AI and the labor market — what's changing and why**
Students deserve honest, age-appropriate information about how AI is reshaping the career landscape they are preparing to enter. This is not scaremongering — it is career counseling.
- ☐ **Ethics of AI — who benefits, who is harmed, who decides**
Algorithmic bias, surveillance, data privacy, and AI in criminal justice are not abstract topics. These are systems your students are already subject to. They should understand them.

 **Free curriculum resource:** AI4K12 (ai4k12.org) provides grade-band progression charts and curriculum materials aligned to this course scope — at no cost. MIT's Day of AI (dayofai.org) provides free lesson plans built for high school classrooms. Do not build this from scratch.

Computer Science Principles — Reform from Elective to Required

Currently an AP option. Should be a standard diploma requirement at the non-AP level.

CSP covers computational thinking, data, the internet, algorithms, and programming — all foundational to understanding AI. It already exists as a College Board AP course. A non-AP version of CSP should be a graduation requirement, not a reward for academically advanced students. Every student should understand how code and data systems work, even if they never write a line of code professionally.

Districts that cannot implement this immediately should at minimum: offer CSP as a free elective with active counselor encouragement, not as a gated AP-only option, and track enrollment by demographic to identify access gaps.

"Future of Work" Senior Elective — 1 Semester, Grades 11-12

An honest conversation about the economy they are about to enter.

A senior-year elective that combines labor economics, career strategy, and applied AI skills. Students analyze labor market projections, audit their own career interests against automation risk, build professional AI tool portfolios, and develop the personal brand and adaptability skills that AI-era employers value. This is not career day. This is structured preparation for economic reality.

This course can be co-developed with local employer partners and community college faculty — reducing development burden on your teaching staff significantly.

Courses to Dissolve or Fundamentally Reform

DISSOLVE

REFORM

Standalone "Keyboarding" Courses — Time to Evolve

REFORM

Basic keyboard fluency belongs in middle school. High school time can build on it.

Basic keyboarding should be mastered at the middle school level so high school can build on that foundation rather than repeat it. The time currently allocated to standalone typing courses in high school is time that could be developing AI Foundations, computer science, or AI-augmented productivity skills. Voice-to-text, AI-assisted writing, and multimodal interfaces are reducing the standalone strategic importance of typing speed.

If you teach Keyboarding or Business Technology: Your expertise is central to what comes next — not obsolete. The teachers who understand basic tech fluency and professional office skills are the natural leaders for rebuilding these courses around AI-augmented productivity. "How do you use AI to accomplish professional tasks?" is a direct evolution of "How do you use software to accomplish professional tasks?" We are not eliminating your course. We are elevating it.

The skills matter. The scope needs to expand.

Courses built around basic software operation — formatting Word documents, making slides, basic Excel — teach real workplace skills. The issue is scope, not value. Students who graduate knowing how to use these tools operationally, but who have never used AI to augment their productivity, are entering workplaces where AI-assisted workflows are already standard. Rebuild these courses around "**AI-Augmented Professional Productivity**": how to use AI to accomplish professional tasks faster and better, how to prompt AI effectively, how to evaluate and edit AI output, and how to build professional workflows using modern tools. The existing tools still belong in the course — but they are the baseline, not the ceiling.

For Business Technology teachers: You already teach the most job-relevant course in the building. Adding AI productivity tools to what you teach is a natural expansion, not a replacement. You're in the best position to lead this evolution.

Career Exploration Courses Using Pre-2022 Labor Data — Rebuild from Ground Up **REFORM**

If your career curriculum hasn't been updated since before GPT-4, it is actively misinforming students.

Any course or counseling material that describes stable career paths in administrative support, customer service, basic accounting, data entry, paralegal work, or entry-level finance without addressing AI's impact on those fields is giving students false information. This is not neutral — it is misleading. Every career pathway description, interest inventory, and counseling resource needs to be updated with current WEF, BLS, and McKinsey labor market projections. Your ACIL should own this audit. It should be completed in the first semester.

What to Add to Existing Courses — Subject by Subject

Not every AI integration requires a new course. Most of it should be woven into what teachers already do. The following additions are specific enough to be assigned to departments — not vague enough to be ignored.

English / ELA

- Unit: Critical evaluation of AI-generated text — how to identify AI writing, fact-check claims, evaluate sources that AI cites
- AI-assisted editing process with required transparency: students document which AI suggestions they accepted, rejected, and why
- Research paper evolution: how to use AI for literature synthesis while applying own analytical argument
- Rhetoric of AI: how AI shapes persuasion — advertising, political content, recommendation algorithms
- Replace some traditional research paper assignments with annotated process portfolios showing AI interaction

Science

- Unit: How AI is used in scientific research — drug discovery, climate modeling, genomics, astronomy

→ Data collection projects using AI tools to analyze results — then critique what the AI missed or misinterpreted

→ Unit: Reproducibility and AI — what happens when AI is trained on flawed data (real case studies)

→ Ethics of AI in science: who owns AI-generated discoveries? How do we attribute AI-assisted research?

→ Lab reports: require one section on "how AI tools could/could not assist this experiment and why"

Social Studies / History

→ Unit: AI and labor — connect current AI disruption to historical automation waves (Industrial Revolution, computers displacing typists)

→ Unit: AI and democracy — algorithmic content curation, deepfakes, election interference, surveillance capitalism

→ Unit: AI and global power — US vs. China AI competition, who controls AI infrastructure and why it matters

→ Unit: Who builds AI? — demographics of the tech workforce and what that means for whose values AI reflects

→ Current events component: monthly AI news analysis using primary sources

Mathematics

→ Integrate data literacy throughout: every statistics unit should include real-world AI datasets

→ Probability and uncertainty — directly foundational to understanding why AI makes errors

→ Algebra II / Pre-Calc: introduce the concept of optimization algorithms (without heavy coding)

→ Statistics: "What do these numbers actually say?" — apply to AI performance claims in news articles

→ Replace some abstract word problems with labor market data problems (WEF data, BLS projections)

Career & Technical Ed (CTE)

→ Every CTE pathway must include a "How AI is changing this field" unit — specific, current, not generic

→ Business CTE: AI-augmented business operations, customer service AI, data analysis tools

→ Health Science CTE: AI in diagnostics, medical imaging, electronic health records, drug discovery

→ Agriculture CTE: precision agriculture AI, crop yield prediction, drone and sensor technology

→ Arts/Media CTE: generative AI in creative fields — what it does, what it can't do, ethical use

→ Industry credential additions: Google Career Certificates, AWS Educate pathway — offer in CTE tracks

Fine Arts / Electives

→ Art: AI-generated image tools — what they are, how they're trained on human art, ethical debates around copyright and compensation

→ Music: AI music generation tools — practical exposure + discussion of creative authenticity

→ Drama/Media: Deepfakes, synthetic voices, AI in filmmaking — practical and ethical dimensions

→ Journalism: AI in news production — fact-checking AI-generated news, synthetic media detection

→ All electives: "How is AI affecting this field professionally?" — at minimum one unit per course

Why This Approach Works — Not Just What to Do

Decades of cognitive science research has produced clear, reproducible findings about how humans actually learn and retain information. These findings should shape how AI education is designed and delivered. This is not optional context — it is the difference between students who can recall AI concepts on a Friday quiz and students who can apply AI thinking in a job interview two years from now.

PRINCIPLE 01

Spaced Practice

Learning distributed over time produces dramatically better retention than the same material covered in one intensive session. The "forgetting curve" is real and steep.

APPLY THIS:

Don't teach all AI content in one course. Distribute AI literacy across all four years of high school, returning to core concepts with increasing depth. The AI Foundations course in 9th grade plus AI integration in every subsequent subject creates the spacing needed for durable learning.

PRINCIPLE 02

Retrieval Practice

The act of recalling information from memory strengthens it more than re-reading or re-watching. Low-stakes testing is one of the most powerful learning tools available.

APPLY THIS:

Regular, low-stakes AI literacy checks across all courses — "Before you use AI today, write for 5 minutes: what is one limitation of AI tools and why does it matter for this task?" The retrieval attempt itself is the learning event.

PRINCIPLE 03

Interleaving

Mixing different topics or skills during practice — rather than blocking all practice on one topic — produces better long-term transfer to new situations.

APPLY THIS:

Don't silo AI skills in a single AI course. Deliberately teach AI literacy skills in English, science, social studies, and math. A student who has used AI for writing, research, data analysis, and historical inquiry has encountered it in enough contexts to apply it in new ones.

PRINCIPLE 04

Desirable Difficulties (Struggle Time)

Tasks that are appropriately challenging — that require real cognitive effort — produce more durable learning than tasks that are easy. Removing difficulty feels like help but isn't.

APPLY THIS:

Require students to attempt every meaningful learning task independently before AI access is permitted. Minimum 10-15 minutes of independent effort. This is not punishment — it is how expertise develops. The ACIL should train faculty on why "making it easier with AI" is often "making it worse pedagogically."

Metacognition

Students who think about their own thinking — who monitor their understanding and reflect on their learning process — consistently outperform those who don't, across all subjects and age groups.

APPLY THIS:

After every AI-assisted task, require a brief written reflection: "What did I contribute? What did the AI contribute? What did the AI get wrong or miss? What would I have done differently?" This single habit, applied consistently, builds the self-awareness that employers call "AI judgment."

Concrete Before Abstract

Students understand abstract principles better when they first encounter concrete examples. The reverse order (abstract principles first) consistently produces weaker understanding.

APPLY THIS:

Introduce AI tools in concrete, real-world contexts before teaching underlying principles. "Here is an AI that misdiagnosed this image — why?" before "Here is how neural networks process visual data." The specific failure case makes the abstract principle meaningful.

Cognitive Load Management

Working memory has real limits. Overloading learners with too much new information at once produces shallow processing and rapid forgetting.

APPLY THIS:

Don't introduce 10 new AI tools to faculty or students at once. Introduce one, practice it, assess comfort, then introduce the next. This is especially critical for faculty PD. The ACIL should sequence PD in 4-6 week increments, not one overwhelming professional development day.

Transfer of Learning

Skills learned in one context rarely transfer automatically to new contexts. Transfer requires deliberate practice in multiple settings and explicit instruction on when and how to apply skills.

APPLY THIS:

Explicitly teach AI skills in multiple contexts — this is why cross-curricular integration matters. A student who has practiced critical evaluation of AI outputs in English class, science class, and social studies is far more likely to apply that skill on the job than one who only practiced it in "AI class."

"In education, it means protecting the struggle — letting students wrestle with problems before offering AI assistance, creating spaces where the friction of figuring things out is the point rather than an inefficiency to eliminate."

The Full Professional Development Plan

Faculty cannot teach what they don't understand. And they will not engage deeply with PD that feels imposed, irrelevant, or condescending. The plan below is designed to be substantive enough to build real competency and structured enough to be sustainable without burning anyone out.

⚠ One-day PD sessions produce minimal behavior change. Everything in this plan requires sustained engagement over weeks, not a single workshop. If your PD budget only allows one day, spend it differently — use the time to train the ACIL and let them run a sustained program.

Phase 1: Foundation Training — All Faculty

Semester 1 · Approximately 8–10 hours total across 6 weeks

☐ **Week 1-2: Complete Google's "Generative AI for Educators" course (free, 2 hours)**

grow.google/ai-for-educators — this is the minimum viable foundation. Covers how generative AI works, how to use it responsibly, and practical classroom applications. Self-paced. Free. Assign this as homework before the first group session.

☐ **Week 3: Group session — "AI in My Classroom: Exploring Tools Together" (2 hours)**

Facilitated by the ACIL. Teachers spend this session actually using AI tools in the context of their subject area — not watching a demo. English teachers try AI for essay feedback. Science teachers try it for data analysis. Math teachers try it for problem generation. Hands-on. Peer discussion. No judgment about comfort level.

☐ **Week 4: Individual exploration — "Assign One AI-Integrated Lesson This Month"**

Each teacher designs and delivers one lesson that meaningfully incorporates AI — either as a tool students use or as a subject students analyze. They document the outcome. ACIL checks in individually to troubleshoot and support. This is where theory becomes practice.

☐ **Week 5-6: Group debrief — "What Worked, What Didn't, What Students Taught Us" (2 hours)**

Each teacher shares their lesson experience — success, failure, and surprise. This peer learning is more valuable than any training session. The ACIL documents what worked and seeds these as models for the next cohort.

☐ **Assessment: Faculty demonstrate one AI-integrated unit to a peer before Phase 2**

Completion of Phase 1 is not clicking through a course. It is demonstrating that you can design and deliver an AI-integrated lesson. Peer demonstration, not test. This creates accountability without surveillance.

Phase 2: Learning Communities — Ongoing, Subject-Area Groups

Semester 2 forward · Monthly, subject-area cohorts of 4–6 teachers

After foundation training, the ongoing PD model is peer learning communities organized by subject area. Each community meets monthly for 60–90 minutes. The agenda is simple: share one thing you tried with AI, discuss what the students did with it, review one new resource or tool, and set one goal for next month.

☐ **ACIL facilitates communities in Semester 2, then hands off to community leaders**

By the second year, each learning community should have an internally identified leader who runs the monthly session. ACIL attends quarterly as resource and connector, not as facilitator of every meeting.

☐ **Communities share resources via a shared, curated folder (Google Drive or equivalent)**

The ACIL maintains a district-wide resource folder organized by subject area. Teachers contribute AI-integrated lesson plans, rubrics, and policy language. This institutional knowledge survives teacher turnover.

☐ **Annual cross-community showcase — "What We Built This Year"**

End of each year: each learning community presents one AI-integrated unit they developed. Recorded for the district resource library. Celebrated publicly. This creates positive social proof and raises the visibility of innovation.

Compensation and Incentives

Faculty who develop excellent AI-integrated curriculum are doing curriculum development work. Expecting this on top of a full teaching load with no recognition is how good initiatives die. Even small compensation signals that this work is valued.

WHAT TO OFFER

→ \$500–\$2,000 internal curriculum development grant for faculty who build AI-integrated units that are adopted district-wide

→ Recognition in the annual AI Readiness Report (named credit for innovation)

→ Priority for conference attendance/professional development funding for AI education events

→ Letters of support for grant applications that include AI integration work

→ Public board presentation opportunity for teachers doing exceptional AI innovation work

FREE PD RESOURCES FOR FACULTY

→ **Google AI for Educators** — grow.google/ai-for-educators (free, self-paced)

→ **MIT Day of AI** — dayofai.org (free HS curriculum + teacher training)

→ **AI4K12 Educator Resources** — ai4k12.org/resources (free, CSTA-backed)

→ **OpenAI Academy** — free training for educators, community college partnerships

→ **MIT/Google GenAI for Educators** — free 2-hour self-paced course via MIT RAISE

The Three-Zone AI Use Policy Framework

Blanket bans teach students that AI is something to hide from authority figures — not a life skill. Blanket permission leaves students without judgment and reduces learning. Every district needs a nuanced, specific policy that faculty can actually

implement consistently. The Three-Zone Framework is that policy.

Zone 1: AI-Free

No AI tools of any kind permitted. Human cognition only.

Examples: First drafts of personal essays, in-class exams, oral presentations, hands-on labs, creative brainstorming sessions

Zone 2: AI-Transparent

AI tools may be used with full disclosure. **For high-stakes assignments:** students must complete an independent first draft before using AI, and must demonstrate understanding through an in-class check, process portfolio, or brief oral review.

Examples: Research projects, revised drafts, data analysis tasks, complex research synthesis. Requires AI Contribution Statement + evidence of independent thinking (not just disclosure).

Zone 3: AI-Collaborative

AI tool use is the explicit learning objective. Students practice using AI effectively and critically.

Examples: AI Foundations course activities, AI-augmented productivity lessons, critical evaluation exercises, tool comparison projects

The AI Contribution Statement — Use This in Zone 2 Assignments

Students attach this to any work where AI assistance was used

AI Contribution Statement

- 1. Which AI tool(s) did I use for this assignment? _____
- 2. What specifically did I ask the AI to help with? _____
- 3. What did I change or reject from what the AI provided? _____
- 4. What parts of this work are entirely my own, without AI assistance? _____
- 5. What did the AI get wrong or miss that I had to correct? _____
- 6. How did using AI change how I approached this task? _____

This statement is not a confession. It is a metacognitive tool. Students who complete it regularly develop the self-awareness that AI-era employers call "AI judgment." Make it a habit, not a punishment.

A growing number of students — particularly at the secondary level — are declining to use AI tools on ethical grounds: environmental impact (water consumption and carbon cost of AI inference), labor exploitation in training data annotation, copyright violations in training datasets, and concern about job displacement in creative fields. These are documented, legitimate concerns grounded in real evidence. Dismissing them or penalizing the students holding them is both intellectually dishonest and counterproductive.

The conversation these students need — and are not currently getting — is not "you're wrong about the harms." It is: *ethical people opting out of a technology does not reduce that technology's power or adoption. It simply removes the most thoughtful users from the room where the tool is being deployed.* The students who understand AI's harms most deeply are the ones who most need to be in conversations about how it is used.

IMPLEMENTATION

☐ **Student formally declares AI-free status at the start of each semester — in writing, on file**

Not a sworn oath requiring surveillance. A formal acknowledgment that the student has chosen this track and understands its requirements. Filed with the ACIL and the relevant teacher.

☐ **All major assignments include a mandatory oral defense component**

A student who used AI to draft an essay and memorized it can pass a written integrity check. They cannot hold up under a 10-minute conversation with a teacher who knows the subject. The oral defense is the verification mechanism — not a sworn statement, not an honor pledge. It is also, not incidentally, a better pedagogical practice than any written test.

☐ **Rubrics explicitly reward demonstrated reasoning and process — not polished prose**

AI produces cleaner prose than humans working under deadline pressure. That should not be the measure of learning, and it should never be the criterion that penalizes a student for working without AI assistance.

☐ **Transcript notation: "Demonstrated Unassisted Mastery" on qualifying work**

No extra credit — rewarding the absence of a tool implies AI use is inherently lesser. Instead, students who complete the AI-Free track with oral defenses intact receive a formal notation on their academic record. Colleges will notice. Some will actively value it.

☐ **Students receive explicit, honest instruction on the labor market implications of their choice**

Not to shame the decision — to inform it. A student choosing AI-free status deserves an honest conversation: here is the wage premium currently attached to AI fluency, here is how hiring is changing in your field of interest, here is what this choice costs you competitively and what it does not. They are entitled to make an informed decision. That means giving them the information, not withholding it to avoid

discomfort. Students who understand the tradeoff and make the choice anyway are exercising genuine agency. That is worth respecting.

Assessment Must Change

If an AI can trivially complete your assignment, the assignment is no longer assessing what students know. This does not mean eliminating all written assignments — it means redesigning them so the measure of learning is resistant to being outsourced.

AI-VULNERABLE ASSESSMENTS

- ✗ Take-home essays with broad prompts ("Discuss the causes of WWI")
- ✗ Research summaries without documented process
- ✗ Multiple choice tests on factual recall (lower-order Bloom's)
- ✗ Generic problem sets students can photograph and ask AI to solve
- ✗ Book reports or article summaries without class-specific context

AI-RESISTANT ASSESSMENTS

- ✓ Oral defenses of written work (student must explain every claim)
- ✓ Portfolio with annotated revision history showing process
- ✓ Timed in-class writing on class-specific, unpredictable prompts
- ✓ Problem-solving demonstrations while teacher observes
- ✓ Projects tied to local, specific contexts that AI has no data on

SECTION 06B · REQUIRED SAFEGUARDS

Student Data Privacy & AI Vendor Compliance

No student-facing AI tool should be in your district without this framework in place first. This is not a legal technicality — it is the condition under which every other recommendation in this toolkit operates. A single board member asking "what vendors, what data, what protections" without a documented answer will table the entire adoption vote.

⚠ Both toolkits have been updated to include this section because the original drafts had no student data privacy framework. That absence is the single most likely board-meeting adoption killer. This section addresses it directly.

Non-Negotiable Vendor & Data Requirements

Complete this before any classroom AI tool goes live

☐ **FERPA compliance confirmed in writing for every AI tool that touches student work**

If a teacher photographs a student's handwritten essay and uploads it to an AI grading tool, that is a FERPA-covered education record. "We use it informally" is not a legal defense. Written data processing agreements are required.

☐ **Prohibited data types defined and communicated to all staff**

The following may NEVER be uploaded to any unapproved AI tool: IEP information, 504 accommodation plans, health records, behavioral discipline records, mental health disclosures, personally identifiable information. These require explicit legal review and parental consent that standard tool use does not provide.

☐ **Vendor data-use agreements prohibit training models on student work**

Many free AI tools improve their models using user-submitted content. Student writing is not training data for a private company's product. Vendor contracts must explicitly prohibit this. If they won't sign that clause, do not use the tool in classrooms.

☐ **Approved tools list maintained by the ACIL and published to staff**

Teachers should not be independently selecting AI tools for classroom use. An approved list vetted by the ACIL, reviewed by legal counsel, and updated annually provides the framework teachers need — and the protection the district needs.

☐ **Incident response protocol for accidental uploads of protected information**

It will happen. A teacher will upload a document that contains a student's accommodation information or last name. The protocol should be written before it happens: who is notified, what the vendor is asked to do, how parents are informed, what is documented.

☐ **Parent-facing plain-language summary of which AI tools are used and how**

The parent who asks "which AI tools are reading my child's work?" deserves a plain-language answer, not a legal document. One page, in accessible language, updated annually. Include it in the back-to-school packet.

Student learning data is not raw material for vendor product development.

This should be stated explicitly in every vendor agreement the district signs. It should also be stated publicly in your district AI policy. If a parent, school board member, or journalist asks whether student data is being used to train AI models, your answer needs to be documented and clear.

Special Education & Students with Disabilities

AI tools create real accessibility opportunities for students with disabilities — text-to-speech, adaptive scaffolding, multimodal content, executive function support. They also create real risks: IEP and accommodation data must never be uploaded to unapproved tools; AI-generated differentiated materials require human review before use; assistive AI tools must meet WCAG 2.1 accessibility standards; students using AI-based assistive technology should not be penalized under academic integrity policies; and oral defense verification for the AI-Free track must have documented alternatives for students with speech or hearing impairments. Special education staff must be included in any AI tool adoption process that affects their students.

Late-Career Teachers

Not every teacher will become an AI integration champion — and that is okay. Some of your most respected, most effective educators are 5–8 years from retirement and have neither the bandwidth nor the motivation to redesign their entire curriculum. Forcing integration produces bad integration and resentment. What you need from every teacher: understand the district's AI use policy, do not use unapproved tools with student data, and participate in baseline literacy PD. Beyond that, pairing late-career teachers with AI-curious colleagues (rather than mandating tool use) produces better outcomes than top-down compliance pressure.

Political Risk in Texas — Know Your Landscape

Texas SB 382 (89th Legislature, 2025) was introduced to prohibit school districts from using AI technology to provide instruction to students. It was referred to committee and did not advance — but it signals a real political environment in which AI in education is contested. If your district adopts this toolkit and a political climate shift occurs, the best protection you have is a documented governance framework: AI is taught as a subject of critical study, AI tools support teachers rather than replace them, parents were consulted before adoption, and all student data protections are documented. That is not just good policy. In Texas in 2026, it is armor.

What Your Counselors Must Know — and How to Get Them There

Counselor AI Labor Market Training — Required Annually

Not optional. Your counselors are your students' first line of career intelligence.

☐ Annual training using WEF Future of Jobs Report + BLS Occupational Outlook Handbook

Counselors should review these two sources at the start of every school year — specifically looking for which occupational categories are growing, which are shrinking, and what skills are most in demand. This is not a one-time training. It is an annual practice. Schedule it in August before students arrive.

☐ Build an AI-Risk Profile for the top 20 careers students in your district most commonly pursue

What are your students' most-chosen career interests? Counselors should be able to tell each student: "Here is the current automation risk profile for that career, here is what's growing within it, and here are the skills that make you more valuable in that field." This requires research. The ACIL can help source it. It should be on every counseling wall.

☐ Partner with at least 5 local employers annually for honest "What do you actually need from our graduates?" conversations

Not speakers at career day. Actual structured conversations with HR and direct managers who review entry-level applications. Their feedback should directly inform what counselors tell students and what teachers emphasize. Schedule these in the fall, share findings in the spring.

☐ Offer AI-relevant industry credentials through the counseling office — track enrollment

Google Career Certificates, AWS Educate, Microsoft Fundamentals — these are free or low-cost, employer-recognized, and achievable in a semester. Counselors should know how to access them, how to recommend them, and track which students complete them. This is a graduation differentiator that costs almost nothing to offer.

☐ Create "AI in My Field" job shadow experiences with local employers — minimum 2 per year

Most students cannot imagine what AI integration looks like in a real workplace. A structured one-day experience at a local healthcare organization, law firm, accounting office, or manufacturing facility where students see AI tools in actual use changes how they think about career preparation. The ACIL coordinates this through the employer advisory council.

SECTION 08 • THE FULL TIMELINE

The 2-Year Cycle: Implementation, Review, and Starting Over

This is not a one-time project. AI capabilities and labor market conditions are changing faster than traditional curriculum review cycles. The model below is a 2-year implementation cycle that repeats — each iteration building on the last, each review informed by student outcomes and labor market changes. This is your district's new normal.

Every 2 years: audit what changed, revise what didn't work, update what became outdated, and celebrate what actually moved students forward.

Year 1: Foundation and Launch

Appoint, Audit, and Announce

- Name and announce the ACIL publicly (board meeting, staff email, community newsletter)
- ACIL completes AI landscape survey of all faculty
- ACIL audits all existing AI-related curriculum and creates gap map
- Superintendent meets with 3-5 local employers to begin advisory council formation
- ACIL completes Google and MIT foundation training courses
- Draft district AI use policy framework (Three-Zone model)

Train Faculty, Pilot Curriculum

- Phase 1 faculty PD begins — all instructional staff (rolling 6-week cohorts)
- AI use policy finalized and published to students, parents, and staff
- Identify 2-3 teachers to pilot AI Foundations mini-unit in existing courses (not a full course yet)
- Employer advisory council holds first meeting — counselors attend
- Counselor AI labor market training session (ACIL-led, 3 hours)
- Begin dual enrollment conversation with nearest community college for CSP access

Expand and Document

- Phase 1 PD completes for all faculty — document completion rates
- Learning Communities launch by subject area (monthly meetings begin)
- Pilot AI-integrated lessons collected into district resource library
- First "AI in My Field" job shadow experience for 11th/12th graders
- Identify which existing courses to reform (Keyboarding, Office Tech, Career Exploration)
- Begin curriculum planning for AI Foundations standalone course (Year 2 launch)

Evaluate and Report

- ACIL produces first annual AI Readiness Report — submitted to board, published publicly
- Faculty survey re-administered — compare to baseline for improvement
- Student survey on AI literacy confidence and tool access
- Employer advisory council Year 1 feedback session — what gaps remain?
- Board presentation: what happened, what worked, what didn't, Year 2 plan
- AI Foundations course curriculum finalized for Year 2 launch

Year 2: Deepen, Scale, and Institutionalize

Q1
AUG-OCT

Launch AI Foundations Course + Scale What Worked

- AI Foundations course launches — at least one section per grade band (9th-10th)
- Phase 2 PD begins — deeper, subject-specific skill building for all faculty
- Keyboarding and obsolete courses formally dissolved or restructured — board approval if needed
- Student AI Ethics Advisory Board formed (8-12 students, applications open)
- Industry credential enrollment begins (Google, AWS, Microsoft pathways in CTE)

Q2
NOV-JAN

Employer Integration and Community Communication

- Employer advisory council second meeting — curriculum feedback session with department heads present
- Parent/community information session: "What We're Teaching About AI and Why"
- AI Foundations course mid-year review — adjust based on student and teacher feedback
- Learning Communities now teacher-led (ACIL attends quarterly, not monthly)
- Assessment redesign workshop for all departments — introducing AI-resistant assessment types

Q3
FEB-APR

Senior "Future of Work" Elective Launch + Credential Completion

- Future of Work elective launches for 11th-12th grade
- First cohort of students completes industry credential (track completion rates by demographic)
- Job shadow experiences expanded — minimum 4 per year
- Student AI Ethics Advisory Board presents first recommendations to administration
- ACIL begins planning for 2-year curriculum review cycle

Q4
MAY-JUL

The 2-Year Review — Starting the Cycle Over

- Full curriculum audit: what changed in AI capabilities and labor market since Year 1 baseline?
- Review AI Foundations course scope — does it still cover the right tools and concepts?
- Employer advisory council: are graduates showing up better prepared? What's still missing?
- Faculty survey third administration — track growth trajectory
- Year 2 AI Readiness Report published — compare measurable outcomes to Year 1
- Set Year 3 targets — update, expand, or revise Year 1 and Year 2 programs based on evidence
- ACIL appointment renewed (or new ACIL identified and onboarded with full handoff)

When you restart the 2-year cycle: the question is not "did we implement our plan?" It is "are our students better prepared for the labor market than they were 24 months ago?" Let the answer to that question drive what changes.

Everything You Need, Organized so You Can Find It

This section is the reference library. Every resource listed here has been vetted for quality, relevance, and accessibility. Cost indicators are marked. This directory should be maintained by the ACIL and updated quarterly.

For Curriculum and Classroom Instruction

FREE CURRICULUM • K-12 • GRADES 9-12 FOCUS

AI4K12 Initiative

CSTA and AAAI-backed national initiative. Provides the Five Big Ideas in AI framework, grade-band curriculum guidelines, and a curated directory of AI education resources. The gold standard for K-12 AI curriculum frameworks.

[ai4k12.org](#)

FREE

FREE CURRICULUM • HIGH SCHOOL • MIT-BUILT

MIT Day of AI

Free AI curriculum developed by MIT RAISE for high school classrooms. Covers how AI works, social impacts, and hands-on activities. Teacher training available. Designed to be used without a CS background.

[dayofai.org](#)

FREE

FREE TEACHER TRAINING • GOOGLE-BUILT

Google AI for Educators

Self-paced professional development for educators on generative AI. Covers practical classroom applications, responsible use, and hands-on activities. 2 hours. No technical background required.

[grow.google/ai-for-educators](#)

FREE

FREE CURRICULUM • AI + ETHICS • HIGH SCHOOL

MIT/Google GenAI for Educators Course

A free, 2-hour self-paced course developed by Google and MIT RAISE specifically for middle and high school teachers. Covers personalizing instruction, responsible use, and practical integration strategies.

[openlearning.mit.edu](#)

FREE

FREE COURSE PLATFORM • STUDENT-FACING

Code.org AI Curriculum

Free, browser-based AI and machine learning curriculum for high school students. No coding experience required. Includes lesson plans and

teacher guides. Used in 200,000+ classrooms.

code.org/ai

FREE

FREE COURSES • STUDENT AND TEACHER FACING

Machine Learning for Kids

Free browser-based platform where students train machine learning models without coding. Builds intuitive understanding of how AI learns from data. Excellent for AI Foundations course activities.

machinelearningforkids.co.uk

FREE

FREE AI LITERACY K-12

Skill Struck AI Literacy

Free AI literacy curriculum aligned to AI4K12 guidelines. Covers how machines sense, learn, and make decisions. Includes teacher dashboards and student rosters. 22-28 lessons per grade band.

skillstruck.com/ai-literacy

FREE

DIGITAL CITIZENSHIP • FREE • COMMON SENSE

Common Sense Media Digital Citizenship

Comprehensive digital citizenship curriculum including AI-specific modules on media literacy, data privacy, and algorithmic awareness. Free for educators. Grades K-12 scope and sequence available.

commonsense.org/education

FREE

INDUSTRY CREDENTIALS • STUDENT-FACING

Google Career Certificates

Industry-recognized certificates in IT Support, Data Analytics, AI Essentials, and more. Available through Coursera. Many districts can access at low/no cost for high school students through workforce development funding.

grow.google/certificates

LOW COST

INDUSTRY CREDENTIALS • STUDENT-FACING • AMAZON

AWS Educate

Free cloud computing and AI skills platform for students. Includes career-aligned learning paths, badges, and job board. No AWS account required for students. Covers machine learning fundamentals, cloud basics, and AI applications.

aws.amazon.com/education/awseducate

FREE

For Labor Market and Career Data

WEF Future of Jobs Report

Published annually by the World Economic Forum. The most comprehensive global survey of employer AI adoption, job creation and displacement projections, and fastest-growing skills. Essential reading for counselors and ACIL. Free download.

weforum.org/publications/future-of-jobs

FREE

BLS Occupational Outlook Handbook

Bureau of Labor Statistics free database of job growth projections, required skills, and median wages for hundreds of occupations. Updated annually. Essential for counselor training and career curriculum updates.

bls.gov/ooh

FREE

ITDF Research Reports

Elon University's Imagining the Digital Future Center — the research base for this toolkit. Reports on AI's impact on human capacities (2025), human resilience infrastructure (2026), and more. Free PDF downloads. Essential for board presentations.

imaginingthedigitalfuture.org

FREE

TeachAI Policy Guidance

Free AI policy guidance for K-12 school districts. Includes sample policy language, implementation guides, and a growing community of districts sharing AI integration experiences. Developed by CSTA, Khan Academy, and others.

teachai.org

FREE

For Administrator and Board Briefings

Your State Education Agency AI Guidance

Most state education agencies (California, Texas, Massachusetts, etc.) have published AI in education guidance documents. Check your SEA website directly — these are updated frequently and contain state-specific policy context your board needs.

The Superintendent's Annual Accountability Checklist

At the end of each school year, this checklist should be completed by the ACIL and reviewed with the Superintendent before board presentation. Items marked and percentages tracked over time.

Year-End Review Checklist

Complete this before your annual board presentation

- ☐ **AI Curriculum Integration Lead: Named, active, and compensated**
Y/N and compensation amount. If N, this is the first failure point — everything else depends on it.
- ☐ **% of faculty who completed Phase 1 PD (target: 40% Year 1, 85% Year 2, 100% Year 3)**
Track by department. If Science is at 90% and Arts is at 20%, the gap is meaningful and needs targeted support.
- ☐ **% of students who received meaningful AI literacy instruction (target: 25% Y1 → 75% Y2 → 100% Y3)**
Not "exposure to a mention of AI." A lesson, unit, or course where AI was the subject of substantive, purposeful learning.
- ☐ **AI use policy: Published, current (reviewed in last 12 months), and consistently applied**
Ask three teachers to summarize the policy. If their summaries are significantly different, the policy is not being consistently applied.
- ☐ **Employer advisory council: Met at least twice, counselor and ACIL present, feedback documented**
If the council only met once and produced no documented feedback, it functioned as a ceremonial exercise. Two substantive meetings with documented curriculum input is the minimum.
- ☐ **Counselors: Completed annual AI labor market training and updated career resources**
Ask a counselor: "What is the automation risk for [a common career students pursue]?" If they don't know, the training has not happened or has not landed.
- ☐ **# of students who completed an AI-relevant industry credential this year**
Target: 5% Year 1 → 30% Year 2 → 60% Year 3. Track by demographic to identify access gaps.
- ☐ **AI Readiness Report: Published publicly, reviewed by board, includes measurable year-over-year comparison**
If this report does not exist, you have not created public accountability for your commitments.
- ☐ **Obsolete courses dissolved or reformed per curriculum plan**
Name which courses were dissolved/reformed and what replaced them. If none, name what the barrier was and when it will be resolved.
- ☐ **Student AI Ethics Advisory Board: Formed, met at least 3 times, produced at least one recommendation reviewed by administration**
If students haven't had formal input into AI policy, you've missed both a learning opportunity and a perspective you genuinely need.

The students in your high schools right now will enter the workforce before many of these AI tools are even obsolete. They deserve to arrive equipped. This toolkit is only useful if someone acts on it. That someone is you.
